Information on likely routes of exposure

Specific information about the product are not available.

The following information are assumed from the toxicological behaviour of the components; whenever they are available.

QUARTZ – FREE CRYSTALLINE SILICA

PENETRATION METHODS:	inhalation.
ACUTE TOXICITY:	prolonged and repeated exposure to fine crystalline silica dust may cause silicosis.
CANCEROGENESIS:	- IARC (International Agency for Research on Cancer) has classified crystalline silica as a probable cause of lung cancer in humans (group 2A); furthermore, it asserts that the carcinogenic effects depend not only on the characteristics of the substance, but also on the physical-biological characteristics of the environment and the person (IARC Monographs, vol. 68, 1997). - IOM (Institute of Occupational Medicine) maintains that the results of epidemiological research are as yet insufficient to establish a direct correlation between crystalline silica and the onset of lung cancer in humans, but has observed a tendency to develop the disease in patients affected by silicosis.
